

# Conceptual Topos As Semantic Cage: An Algebraic Topology of Meaning based on Conceptual Topology

---

Written by No Name Yet Exist

Contact: Written Below

## Introduction

---

Conceptual Topos v1.0 is an initial formalization of the algebraic topology of meaning based on Conceptual Topology.

This version sketches core axioms for Topos including:

- Initial Object
- Subobject Classifier  $\Omega$
- Terminal Object
- Fibered Topos structure
- Semantic Exponential via  $\sigma$  operator

Finite Limits (Pullbacks, Products, Equalizers) are under ongoing formalization.

Future versions (v1.x) will refine the formalization and extend it.

# 1. Monoid Structure of Semantic Flow (M|Z):

In Conceptual Topology, Z is defined as a mediating point/semantic anchor.

Let  $C$  and  $D$ ,  $Z$  be categories,  
with semantic projection  $\pi: C \cup D \rightarrow Z$ , such that for each  $X \in \text{Ob}(C \cup D)$ :

$$\pi(X) \in \text{Ob}(Z)$$

For each  $X \in \text{Ob}(C \cup D)$ , there exists morphism:

$$f_X: X \rightarrow \pi(X)$$

$$f_X^{-1}: \pi(X) \rightarrow X$$

such that:

$$f_X^{-1} \circ f_X \cong \text{id}_X$$

For morphism  $f: X \rightarrow Y \mid Z$ ,  
this corresponds to:

$$f_Z: \pi(X) \rightarrow \pi(Y) \text{ in } Z$$

For any  $X, Y \in \text{Ob}(C \cup D)$ :

Let  $[X]_Z :=$  semantic representation of  $X$  under frame  $Z$  (i.e.,  $\pi(X)$ )

Then:

$$[X]_{Z1} \cong [Y]_{Z2} \mid Z1, Z2 \in Z \text{ //or } Z1, Z2 \gg Z$$

which means:

$$["\text{Dog}"]_{\text{Pet}} = [\text{Retriever}, \text{Dachshund}, \text{Poodle}, \text{Bulldog}, \dots]$$

$$["\text{girl}"]_{\text{Human}} = [\text{girl}, \text{woman}, \text{person}, \dots]$$

$$["\text{Dog}"]_{\text{Pet}} \cong ["\text{girl}"]_{\text{Human}} \mid \text{Life}$$

Then the set of semantic flow morphisms under  $Z$  forms a monoid:

$$M|Z = \{ f_n \circ \dots \circ f_1 \mid \text{all } f_i: X_i \rightarrow X_{i+1} \mid Z \wedge \forall i, j: f_i \cong f_j \mid Z \}$$

This is also defined as Morphic Chain:

Let  $**D(C_{n-1} \mid Z)** :=$  Category of Morphic Chains over  $**\text{Ob}(C_{n-1})**$  within a given  $Z$ -frame.

$$\text{where: } D(C_{n-1} \mid Z) = \{ C_0 \rightarrow C_1 \rightarrow C_2 \rightarrow \dots \mid Z \}$$

or as a set

$$D(C_{n-1} \mid Z) = \{ C_0, C_1, C_2, \dots \mid Z \}$$

## 2. Identity Element of $M|Z$

Let:  $M|Z = \{ f_n \circ \dots \circ f_1 \mid \text{all } f_i: X_i \rightarrow X_{i+1} \mid Z \wedge \forall i, j: f_i \cong f_j \mid Z \}$

Define the identity element of  $M|Z$  as a family of identity morphisms over the shared  $Z$  frame:

For each  $X \in \text{Ob}(C \cup D)$ , there exists a unique identity morphism under a  $Z$  frame:

$e|Z_X := \text{id}_X \mid Z$

Then, for any  $f: X \rightarrow Y \mid Z \in M|Z$ :

$e|Z_X \circ f = f$

$f \circ e|Z_Y = f$

Therefore, the identity structure of  $M|Z$  is given by the family:

$\{ \text{id}_X \mid Z \mid X \in \text{Ob}(C \cup D) \}$

which forms a pointwise identity across the objects under the common  $Z$  frame.

This ensures that  $M|Z$  satisfies the identity axiom of a monoid.

## 3. Associativity of $M \mid Z$

Let:  $M|Z = \{ f_n \circ \dots \circ f_1 \mid \text{all } f_i: X_i \rightarrow X_{i+1} \mid Z \wedge \forall i, j: f_i \cong f_j \mid Z \}$

Then for all  $f, g, h \in M|Z$ :

$(f \circ g) \circ h = f \circ (g \circ h)$

Thus, the composition  $\circ$  in  $M|Z$  is associative.

## 4. Axioms

### 4.1. Identity Element

#### Unit Axiom 1: Identity Element Z

$$\text{id}_Z := Z \rightarrow Z \mid Z$$

$$\forall f \in M|Z: \text{id}_Z \circ f = f \quad \text{and} \quad f \circ \text{id}_Z =$$

#### Definition:

Statement:  
Z-frame itself is the unit of  $M \mid Z$ .

Formal Definition:  
 $Z := Z \rightarrow Z \mid Z$

Justification:  
Since any morphism in  $M \mid Z$  is defined as:

$$f: X \rightarrow Y \mid Z$$

and Z itself is defined as its own identity morphism:

$$Z := Z \rightarrow Z \mid Z$$

then:  
 $\text{id}_Z = Z$

Conclusion:

Therefore:  
 $\text{id}_Z$  is the unit element of  $M|Z$ .

$$\forall f \in M|Z: (\text{id}_Z \circ f \mid Z) = f \quad \text{and} \quad (f \circ \text{id}_Z \mid Z) = f$$

(with frame-preserving composition)

$\therefore \text{id}_Z$  is the unit of  $M|Z$ .

#### Note:

$$\text{id}_Z : Z \rightarrow Z \mid Z$$

$$f : X \rightarrow Y \mid Z$$

$$(\text{id}_Z|Z) \circ (X \rightarrow Y|Z)$$

## Unit Axiom2: Void Concept

$$f \in M|Z$$

$$"" \circ f = f \text{ and } f \circ "" = f$$

$$\text{id}_Z \circ f = f \text{ and } f \circ \text{id}_Z = f$$

### Definition:

The empty concept is a theoretically assumed concept, denoted as "", which acts as the unit element at the conceptual / lexical level.

Formal Definition:

$$"" \circ f = f \text{ and } f \circ "" = f$$

Justification:

The empty concept "" represents no lexical or semantic content. Composing any morphism f with the empty concept does not alter the flow of meaning.

Conclusion:

"" is the unit element at the conceptual level of Conceptual Topology.

## 4.2. Zero Morphism: Negation Morphism

We define semantic zero morphism, negation morphism:  $n_f$  In CT as the result of applying Not() to a morphism

$$g: \sigma(Z). \text{ Not}(g)\{ A \dashv B \mid Z \} = A \dashv B|Z = n_f$$

where:  $g: A \rightarrow B$

Formal Properties (Axiom):

$\forall g: X \rightarrow Y|Z$  where composition with  $n_f$  is defined:

$$\forall g: g \circ n_f = n_f \text{ and } n_f \circ g = n_f$$

Left Side:

$g: A \rightarrow B$

$$g \circ (A \dashv B|Z) = A \dashv B|Z$$

Right Side

$$g: A \rightarrow B(A \dashv B|Z) \circ g = A \dashv B|Z$$

Interpretation:

Applying Not() to any morphism produces a semantic zero morphism, which collapses any further semantic flow.

Natural Language:

Left Side:  $g \circ (A \dashv B | Z)$

"A is not B"

The apple is not a fruit

Right Side:  $(A \dashv B | Z) \circ g$

"B is not A"

This is a fruit, but this is not an apple which is a fruit.

In CT, this was called `rupture()`.

Now defined:

$\text{rupture}(A, B, Z) = \sigma(Z). \text{Not}(g) = n\_f = A \dashv B | Z$

### 4.3. Composition Axiom

$$M|Z = \{ f_n \circ \dots \circ f_1 \mid \text{all } f_i: X_i \rightarrow X_{i+1} \mid Z \wedge \forall i, j: f_i \cong f_j \mid Z \}$$

Then for all  $f, g, h \in M|Z$ :

For  $f, g, h \in M|Z$ ,

where:

$f: V \rightarrow W \mid Z$

$g: Y \rightarrow V \mid Z$

$h: X \rightarrow Y \mid Z$

$(f \circ g) \circ h = f \circ (g \circ h)$

#### Example:

For  $f, g, h \in M|Z$ ,

where:

$f: \text{she} \rightarrow \text{you} \mid \text{Human}$

$g: \text{he} \rightarrow \text{she} \mid \text{Human}$

$h: \text{man} \rightarrow \text{he} \mid \text{Human}$

$(f \circ g) \circ h = f \circ (g \circ h)$

# 5. Conceptual Topos

## 5.1. Category Level: Initial Object

### Definition:

Let  $\text{Concept}$  be a category where  $\text{Ob}(\text{Concept})$  are lexical / conceptual objects.

Then  $"" \in \text{Ob}(\text{Concept})$  is Initial Object if:

$\forall X \in \text{Ob}(\text{Concept}), \exists$  unique morphism:

$$u_X : "" \rightarrow X \mid X$$

such that:

$$\begin{aligned} \forall f: X \rightarrow Y \mid Z, \\ f \circ u_X = u_Y \end{aligned}$$

## Monoid Level: Unit in $M|Z$

Recall:

$$M|Z = \{ f_n \circ \dots \circ f_1 \mid \text{all } f_i: X_i \rightarrow X_{i+1} \mid Z \wedge \forall i, j: f_i \cong f_j \mid Z \}$$

Now, define:

$$"" \in \text{Ob}(\text{Concept})$$

and identity morphism under  $Z$ -frame:

$$e|Z_{} := \text{id}_{} \mid Z$$

Then for all  $f \in M|Z$ :

$$\begin{aligned} e|Z_{} \circ f &= f \\ f \circ e|Z_{} &= f \end{aligned}$$

## 5.2. Finite Limits

**Terminal Object** Conceptual Topos defines a terminal object as the Z-frame identity:

$$\text{id}_Z := Z \rightarrow Z \mid Z$$

Any morphism  $f: X \rightarrow Z \mid Z$  factors uniquely through  $\text{id}_Z$ .

This realizes the semantic universal target:

$$\forall X \in \text{Ob}(C \cup D), \exists! f_{\text{terminal}}: X \rightarrow Z \mid Z$$

**Example:**

```
she → human | Human
me  → human | Human
```

Note: Pullbacks, Products, Equalizers under construction

### 5.3. Exponentials

Conceptual Topos models exponentials via semantic shift operators.

#### Definition

For any objects  $A, B$ :

$B^A$  exists such that:

$$\text{Hom}(X \otimes A, B) \cong \text{Hom}(X, B^A)$$

#### Construction via $\sigma$ operator

Semantic shift operators:

$$\sigma(X). \gg(A, B)$$

or

$$\sigma(X). \>(A, B)$$

act as internal exponential morphisms:

$$(A, B) \cong B^A$$

#### Definition: Semantic Shifting Morphism ( $\sigma$ )

$$\sigma: D(X_{n-1} \mid X) \rightarrow D(X_{n-1} \mid X)$$

such that  $\sigma \oplus f \in M|Z$  if and only if type compatibility holds:

$\forall A, B, (A \rightarrow B) \circ \sigma(X)$  is valid if:

$$(A \gg X \text{ or } X \gg A)$$

and

$$(B \gg X \text{ or } X \gg B)$$

Definition: Subsumption

$$A \gg X \equiv A \sqsubseteq X$$

Definition: SubsumedBy

$$X \gg A \equiv X \sqsubseteq A$$

Example:

$$\text{king} \rightarrow \text{king} \gg \text{human} \rightarrow \text{human}$$

$$\Rightarrow \text{king} \gg \text{human} \rightarrow \text{valid}$$

```
human → human >> queen → queen
⇒ human >> queen → valid
```

Example

```
σ(Human). >>(puppy → dog → mammal | Canine, Human)
≅ girl → she → mammal | Human
```

This shift realizes an internal semantic transformation corresponding to exponential behavior.

5.4. Definition of  $\Omega$

Let  $\Omega$  be an object in the Concept category, representing the **semantic truth space**.

```
For any subobject (conceptual inclusion):

m: M ↪ X

there exists a unique characteristic morphism:

χ_m: X → Ω
```

such that the following diagram commutes:

Interpretation in Conceptual Topology

- $\Omega$  encodes **semantic entailment / membership / inclusion**.
- **Z-frame membership** is naturally mapped to  $\Omega$ :

$$\chi_Z: X \rightarrow \Omega$$

interpreted as:  
"Does X conceptually belong to Z-frame Z?"

Examples

**Example 1: Dog in Pet Z-frame**

$\chi_{\text{Pet}}(\text{Dog}) = \text{True}$

**Example 2: Apple in Pet Z-frame**

$\chi_{\text{Pet}}(\text{Apple}) = \text{False}$

**Example 3: Innocent in Body Z-frame (after rupture)**

$\chi_{\text{Body}}(\text{"innocent"}) = \text{True} / \text{False}$  depending on whether the semantic projection is coherent under Z-Frame.

Relation to Rupture

Semantic rupture can be lifted to  $\Omega$  as:

$\sigma(\text{Not})(f: A \rightarrow B \mid Z) \Rightarrow \text{rupture}(A,B,Z) \Rightarrow \chi_Z(f) = \text{False}$

Thus, **negation** and **semantic discontinuity** become  **$\Omega$ -classifiable**.

# 5.5. Conceptual Topos as Fibered Topos over Z-frame

Conceptual Topos is structured as a **fibered topos** over the semantic base space **Z-frame**.

## Z-frame as Fibered Structure

- Let  $\pi: C \cup D \rightarrow Z$  be the semantic projection.
- Each fiber  $\pi^{-1}(Z)$  forms a category of morphic chains **D(C<sub>n-1</sub> | Z)**.
- Morphisms of the form:

$$X \rightarrow Y \mid Z \equiv X \rightarrow Y \text{ in fiber over } Z$$

correspond to morphisms within the fibered structure over Z.

## Initial Object and Codomain Projection

- The **Initial Object** "" serves as the semantic origin.
- It projects into the codomain via:

$$"" \rightarrow \mid X \equiv "" \rightarrow \pi(X)$$

$$\begin{array}{ccc} "" & & \\ \downarrow u_X & & \\ X & \longrightarrow & \pi(X) \text{ (in Z-frame)} \end{array}$$

$$\begin{array}{l} \text{Fiber } \pi^{-1}(Z_X): \\ "" \rightarrow X \rightarrow Y \end{array}$$

Thus, semantic generation naturally occurs anchored in Z-frame.

## Semantic Flow Closure

- Semantic flows:

$$X \rightarrow Y \mid Z$$

are closed within the fiber over  $Z$ , corresponding to the codomain  $Z$  of the semantic projection  $\pi$ .

- Rupture and negation are classified by  $\Omega$ :

$$\chi_Z: X \rightarrow \Omega$$

## Conclusion

Conceptual Topos is a **fibred topos** over  $Z$ -frame:

$$\pi: C \cup D \rightarrow Z$$

with:

- Initial Object  $"" \rightarrow \text{codomain } \pi(X)$
- Morphic Chains as fibers  $\pi^{-1}(Z)$
- $\Omega$  as subobject classifier in  $Z$
- $\sigma$  operator inducing internal exponential morphisms.

## Conceptual Topos Named as 概念位相論 / Conceptual Topology

This theory, named 概念位相論 or Conceptual Topology, was proposed by **No Name Yet Exist**.
